smoke containment screens • smoke curtains • fire curtains • horizontal fire curtains • smoke & heat release vents • natural ventilation • fire resistant glazing • horizontal glazing • smoke doors • fire doors • intumescent paint & other specialty systems
**Problem**
New internal atrium requiring excessive smoke exhaust volume.

**Solution**
Install 3 9m wide x various drop height Supercoil smoke curtains to reduce the open area of the floor. Therefore reducing the exhaust flow and fan sizes required for a more robust solution.

**Design Considerations**
The system needed to be gravity fail safe and single span (no overlaps) to form a solid barrier to fire air flow through the open area underneath the curtain.

Problem
A heritage and public building required a fire upgrade. Internal stairs were connecting multiple levels and also a path of egress.

Solution
Install Supercoil smoke curtains that suspended approximately 500mm below the ceiling with a glass smoke baffle above.

Design Considerations
The smoke curtains required a wide span and minimal head box size. This was made possible with the installation of Supercoil. The installation team required the necessary skills to troubleshoot unique site situations such as winding the curtain head box in and out of a rigid steel ‘C’-section used to support the glass above.
